CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB    A composition, or article for inhibition of bone growth and resorption comprises an anti-inflammatory agent(s), optionally other agents and carriers, monomer(s), oligomer(s), polymer(s), salt(s), mixtures(s), dispersion(s) and/or blend(s) thereof, which composition, device, or implant upon polymer erosion releases a bone growth and/or bone resorption retarding, reducing or inhibiting amount of the agent(s). The monomers, oligomers and polymers, releasing active or activatable agent(s), have pre-selected properties such as molecular weight, flexibility, hardness, adhesiveness, and other valuable properties. The monomers, oligomers and polymers may be prepared by a process involving various alternative and sequential steps that allow the design a priori of products with specific characteristics. The composition, device, implant or dressing of this patent are suitable for retarding, reducing or inhibiting bone growth or bone resorption, comprising administering or applying to a subject's pre-selected site a bone growth or resorption reducing amount of the agent(s).

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB The invention is directed to an apparatus, such as a medical device,  
 having a surface coated or covered with a decellularized extracellular  
 matrix or having a component comprising the decellularized extracellular  
 matrix for implantation into a subject, preferably a human. In one  
 embodiment of the invention, a decellularized extracellular matrix is  
 used to form a bodily implant such as a vein, an artery, an esophagus,  
 or a ventricular restraining device. In some embodiments of the  
 invention, the decellularized extracellular matrix is configured to be a  
 time released therapeutic. In another embodiment of the invention, a  
 decellularized extracellular matrix forms an aneurysm treatment device,  
 such as an aneurysm coil, a seal, a pouch, or a filler. In a further  
 embodiment of the invention, decellularized extracellular matrix is used  
 to embolize lesions, tumors, or vessels. Methods for making the tissue  
 regeneration scaffold and methods for manufacturing a coated or covered  
 medical device having a component comprising decellularized  
 extracellular matrix of body tissues are also provided.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

LINE COUNT:	1525		
AB	In preferred embodiments, this invention relates to an expandable stent, comprising a tubular member comprising at least two circumferentially-adjacent radial elements, wherein each radial element comprises an engagement slot, through which a portion of the circumferentially-adjacent radial element is slidably engaged, such that the tubular member is capable of expanding from a first collapsed diameter to a second expanded diameter, wherein the engagement slot is not a paired slot.

AB The present invention provides a lumen support stent with a clear through-lumen for use in a body lumen. The stent is formed from at least one series of sliding and locking radial elements and at least one ratcheting mechanism comprising an articulating element and a plurality of stops. The ratcheting mechanism permits one-way sliding of the radial elements from a collapsed diameter to an expanded diameter, but inhibits radial recoil from the expanded diameter.
